DATE MAILED: 01/12/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

## Office Action Summary

**Application No.**

10/676,567

**Applicant(s)**

CRITCHLOW, MICHAEL E.

**Examiner**

McDieunel Marc

**Art Unit**

3661

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 27 October 2005.  
2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.  
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-28 is/are pending in the application.  
4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.  
5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.  
6) ☒ Claim(s) all is/are rejected.  
7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.  
8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.  
10) ☒ The drawing(s) filed on 9/30/2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).  
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some \* c) ☐ None of:  
1. ☐ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).  
\* See the attached detailed Office action for a list of the certified copies not received.

### Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)  
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)  
3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.  
4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.  
5) ☐ Notice of Informal Patent Application (PTO-152)  
6) ☐ Other: \_\_\_\_\_.

### DETAILED ACTION

1. Claims 1-28 are pending for examination and claim 29 had been cancelled.
2. The objected to the abstract is withdrawn.
3. The indicated allowability of claim 22 is withdrawn in view of the newly discovered reference(s) to Kingbright. Rejections based on the newly cited reference(s) follow.
4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.
5. Claims 1-7, 9, 11-15, 17, 19, 23, 25-26 and 28 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Ellis et al.** (U.S. Pub. 20030137766 A1) in view of **Kingbright** (3.65X6.15mm SINGLE CHIP LED BARS).

As per claims 1, 12 and 23, Ellis et al. teaches a system and an associated method having a calibration cartridge for automated cartridge library including a method for calibrating robotic picker mechanisms in automated storage library systems (see section [0038]), comprising:

Art Unit: 3661

detecting a calibration mark associated with a storage library with at least one sensor (section [0038] as mentioned above, wherein calibration position equates calibration mark), wherein the at least one sensor detects the calibration mark from a first position and a second position (see section [0031], wherein optical sensors being used for calibration), the first position and the second position separated by an offset distance (inherently calibration invokes first, second.. and so on offset distance, therefore such limitation belongs to design choice approach); determining a relative shift in the detected calibration mark detected from the first position and the second position; and determining a distance between the calibration mark and a reference position based on the shift in the detected calibration mark, the offset position (see calibration position as mention above and [0041]), and a focal length associated with the at least one sensor used to detect the calibration mark (see section [0031], wherein the optical inherently covers focal length); at least one controller (see sections [0032 and 0069]); a housing adapted to include storage slots and one or more media drives (see fig. 4). Ellis et al. does not specifically teach an optically detectable indicium.

However, Kingbright teaches the indicium which is a rectangle LED that equates to an optically detectable indicium (see Kingbright fig. on page 1).

Therefore it would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the teaching of Ellis et al. 66' with the rectangular shaped LED of Kingbright, because this modification would have enhanced the Ellis et al. 66' so that a rectangular shaped indicium/LED could be introduced to the calibration technique of Ellis et al. 66' , thereby improving the efficiency and the reliability of the library robotics system.

As per claims 2-7, 9, 11, 13-15, 17, 19, 25-26 and 28, Ellis et al. teaches calibration cartridge for automated cartridge library including a method, wherein the reference position is associated with an average position of the first position and the second position; wherein the at least one sensor includes a first sensor and a second sensor separated by the offset distance (falls into design choice) (as mentioned above

Art Unit: 3661

calibration position contains repetition), see foot note<sup>1</sup>; wherein the first position and the second position are in a plane substantially orthogonal to a direction between the at least one sensor and the calibration mark (see fig. 4, however orthogonal direction falls into design choice); further including a light source associated with the gripper assembly for directing light to the approximate position of the calibration mark (see section [0031]).

As per claim 22, Kingbright in view of Ellis et al. 66' teach a rectangular shaped and cross-hair indicium (see Kingbright fig. on page 1 as described above).

6. Claims 8, 10, 18, 20-21 and 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ellis et al. 66' in view of Kingbright as applied to claims 1, 12 and 23 above, and further in view of Ellis (U.S. Pat. No. 5237468 A, hereinafter Ellis et al. 68').

---

<sup>1</sup> Calibration is the process of determining the relationship of sensor output to the actual value of the input. It is desirable to calibrate the complete sensor system if maximum accuracy is required. One way to calibrate is to measure the values at known points and record the outputs obtained. Then, if these input-output relationships are obtained, we know how to correct the sensor at these points, at least. In the domain of robot vision, camera calibration can be partitioned into two categories, according to two different camera parameter types: intrinsic calibration and extrinsic calibration. The former calibrates the intrinsic parameters of a camera, such as focal length, principal point, etc. The latter calibrates the extrinsic parameters like the orientation angles, pose information of the camera focal point with respect to some coordinate system. Briefly, automatic, extrinsic calibration is any procedure which results in the robot's position and orientation being known to a specified level of accuracy based on sensory data and knowledge of the environment. There are at least two reasons why automatic calibration is needed. First of all, calibration by hand is usually tedious and time-consuming. Secondly, owing to the fact that accuracy requirements may be high, a procedure which relies on human judgement and motor skills may have a bigger error than one which is done by machine automatically. In other words, automatic calibration can achieve greater accuracy than manual. Automatic calibration can be related to the general problem of robot pose estimation.

Art Unit: 3661

As per claims 8, 10, 18, 20, 21 and 27, Ellis et al. 66' in view of Kingbright teach essential features of the invention substantially as claimed with the exception of the limitations below taught by Ellis et al. 68' .

However, Ellis et al. 68' teaches a system and an associated method, wherein the at least one sensor is attached to a robotic picker mechanism, wherein the sensor is coupled to a robotic picker mechanism (see section [0031], wherein optical sensor being considered as camera) (see fig. 2, elements 41 and 59); wherein the sensor includes a CMOS imaging device (inherently Ellis 68' camera contains CMOS).

It would have been obvious to a person of ordinary skill in the art at the time of the of the invention to modify the teaching of Ellis et al. 66' and Kingbright with the teachings of Ellis 68' , because this modification would have enhanced Ellis' et al. 66' and Kingbright' s teaching in order to have a camera couple to the picker/gripper, thereby improving the efficiency and the reliability of a library robotics using parallax viewing.

7. Claims 16 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ellis et al. 66' in view Kingbright as applied to claims 16 and 23 above, and further in view of Ellis (U.S. Pat. No. 6385003).

As per claims 16 and 24, Ellis et al. 66' and Kingbright teach essential features of the invention substantially as claimed with the exception of the limitations below taught by Ellis 03' .

---

Art Unit: 3661

However, Ellis 03' teaches a system, wherein the calibration mark is associated with at least one of a storage bin and a drive bezel (see abstract and col. 5, lines 19-26).

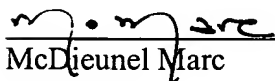

It would have been obvious to a person of ordinary skill in the art at the time of the of the invention to modify the teaching of Ellis et al. 66' and Kingbright with the teachings of Ellis 03' , because this modification would have enhanced Ellis' et al. 66' and Kingbright' s teaching in order to introduce the drive bezel, thereby improving the efficiency and the reliability of a library robotics using parallax viewing.

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to McDieunel Marc whose telephone number is (571) 272-6964.

The examiner can normally be reached on 6:30-5:00 Mon-Thu.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Thomas Black can be reached on (571) 272-6956. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
